- Linear model to predict value of a variable  $y$  using features  $\mathbf{x}$

$$y = \mathbf{x}^T \boldsymbol{\beta} = x_1 \beta_1 + x_2 \beta_2 + \cdots + x_p \beta_p$$

- Least Square Estimation

$$J(\boldsymbol{\beta}) = \frac{1}{2n} (\mathbf{X}\boldsymbol{\beta} - \mathbf{y})^T (\mathbf{X}\boldsymbol{\beta} - \mathbf{y})$$

- Closed form solution

$$\hat{\boldsymbol{\beta}} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

- A ball is rolled down a hallway and its position is recorded at five different times. Use the table shown below to calculate
  - Weights
  - Predicted position at each given time and at time 12 seconds

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

## Step 1: Question

- What are X and Y variables?
- What are the parameters for our problem?
- Calculating parameters

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

## Step 1: Calculate Weights

- What are X and Y variables?
  - Time (X) and Position(Y)
- What are the parameters for our problem?
  - $\hat{\beta}_1$  :Time  $\hat{\beta}_0$  :Intercept
- Calculating parameters
  - $\hat{\beta} = (X^T X)^{-1} X^T y$

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

*Let's calculate on BOARD!*

$$X = \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \\ 1 & 6 \\ 1 & 8 \end{bmatrix}$$

$$y = \begin{bmatrix} 9 \\ 12 \\ 17 \\ 21 \\ 26 \end{bmatrix}$$

$$X^T X = ?$$

$$(X^T X)^{-1} = ?$$

$$X^T y = ?$$

$$\hat{\beta} = (X^T X)^{-1} X^T y = ?$$

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

## Step 2: Apply your model and predict

- Plug time values into linear regression equation

$$\hat{y} = 2.378x + 7.012$$

- Predicted value at time = 12 secs

$$\hat{y}(x = 12) = 2.378 \times 12 + 7.012 = 35.548$$

- Matrix form to predict all other positions

$$\hat{\mathbf{y}} = \mathbf{X}\hat{\boldsymbol{\beta}}$$

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26
12	35.55

Plot: Check your model

$$\hat{y} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \\ 1 & 6 \\ 1 & 8 \end{bmatrix} \begin{bmatrix} 7.012 \\ 2.378 \end{bmatrix} = \begin{bmatrix} 9.390 \\ 11.768 \\ 16.524 \\ 21.280 \\ 26.036 \end{bmatrix}$$

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

Plot: Check your model

Time (s)	Position (m)
1	9
2	12
4	17
6	21
8	26

- Why do we need regularization?
  - Constraint the parameter values
  - Avoid overfitting phenomenon

- Prediction

$$\hat{y} = \mathbf{x}^T \boldsymbol{\beta} = x_1 \beta_1 + x_2 \beta_2 + \cdots + x_p \beta_p$$

- Original Objective

$$\min_{\boldsymbol{\beta}} J(\boldsymbol{\beta}) = \frac{1}{2} \sum_{i=1}^N (\mathbf{x}^T \boldsymbol{\beta} - y)^2$$

- L2-Regularized Objective

$$\min_{\boldsymbol{\beta}} J(\boldsymbol{\beta}) = \frac{1}{2} \sum_{i=1}^N (\mathbf{x}^T \boldsymbol{\beta} - y)^2 + \frac{\lambda}{2} \|\boldsymbol{\beta}\|^2$$

$$\min_{\boldsymbol{\beta}} J(\boldsymbol{\beta}) = \frac{1}{2} \sum_{i=1}^N (\mathbf{x}^T \boldsymbol{\beta} - y)^2 + \frac{\lambda}{2} \|\boldsymbol{\beta}\|^2$$

$$\frac{\partial J(\boldsymbol{\beta})}{\partial \boldsymbol{\beta}} = \sum_{i=1}^N \mathbf{x} (\mathbf{x}^T \boldsymbol{\beta} - y) + \frac{\partial \lambda \|\boldsymbol{\beta}\|^2}{\partial \boldsymbol{\beta}}$$

$$\frac{\partial J(\boldsymbol{\beta})}{\partial \boldsymbol{\beta}} = \sum_{i=1}^N \mathbf{x} (\mathbf{x}^T \boldsymbol{\beta} - y) + \lambda \boldsymbol{\beta}$$

$$\nabla_{\boldsymbol{\beta}} J(\boldsymbol{\beta}) = 0$$

$$\nabla_{\boldsymbol{\beta}} \left( \frac{1}{2} \|\mathbf{X}\boldsymbol{\beta} - \mathbf{y}\|^2 + \frac{\lambda}{2} \|\boldsymbol{\beta}\|^2 \right) = 0$$

$$\nabla_{\boldsymbol{\beta}} \left( \frac{1}{2} (\mathbf{X}\boldsymbol{\beta} - \mathbf{y})^T (\mathbf{X}\boldsymbol{\beta} - \mathbf{y}) + \frac{\lambda}{2} \boldsymbol{\beta}^T \boldsymbol{\beta} \right) = 0$$

$$\mathbf{X}^T \mathbf{X} \boldsymbol{\beta} - \mathbf{X}^T \mathbf{y} + \lambda \mathbf{I} \boldsymbol{\beta} = 0$$

$$\boldsymbol{\beta} = (\mathbf{X}^T \mathbf{X} + \lambda \mathbf{I})^{-1} \mathbf{X}^T \mathbf{y}$$

## Regularization methods

- L2 normalization (Ridge)

$$\min_{\beta} \sum_{i=1}^n (y_i - \beta_0 - \sum_{j=1}^p \beta_j x_{ij})^2 + \lambda \sum_{j=1}^p \beta_j^2$$

- L1 normalization (Lasso)

$$\min_{\beta} \sum_{i=1}^n (y_i - \beta_0 - \sum_{j=1}^p \beta_j x_{ij})^2 + \lambda \sum_{j=1}^p |\beta_j|$$

- Dropout (in neural networks)
- Early Stopping

- Why normalize features ?
  - Different feature ranges such as  $[-1, 1]$  and  $[-100, 100]$  may negatively affect algorithm performance.
  - Thus, small change in bigger range can affect more than huge change in smaller range.
- **Calculate Z-Score (Standard Score)**

$$z_{ij} = \frac{x_{ij} - \mu_j}{\sigma_j}$$

- $z_{ij}$  → the standard score for feature  $j$  of data point  $i$
- $x_{ij}$  → the value of feature  $j$  of data point  $i$
- $\mu_j, \sigma_j$  → the mean and standard deviation of feature  $j$

Galaxy	Distance (Mpc)	Velocity (km/sec)
Virgo	15	1,600
Ursa Minor	200	15,000
Corona Borealis	290	24,000
Bootes	520	40,000

- How to Normalize feature “Distance” ?

Galaxy	Distance (Mpc)	Velocity (km/sec)
Virgo	15	1,600
Ursa Minor	200	15,000
Corona Borealis	290	24,000
Bootes	520	40,000

- How to Normalize feature “Distance” ?
  - Computer mean and deviation first

$$\mu_{\text{dist}} = ? \quad \sigma_{\text{dist}} = ?$$

Galaxy	Distance (Mpc)	Velocity (km/sec)
Virgo	15	1,600
Ursa Minor	200	15,000
Corona Borealis	290	24,000
Bootes	520	40,000

- How to Normalize feature “Distance”?

- Computer mean and deviation

$$\mu_{\text{dist}} = 256.25, \sigma_{\text{dist}} = 181.71$$

- Computer Z-Score for each sample

$$z_{ij} = \frac{x_{ij} - \mu_j}{\sigma_j}$$

Galaxy	Distance (Mpc)	Velocity (km/sec)
Virgo	15	1,600
Ursa Minor	200	15,000
Corona Borealis	290	24,000
Bootes	520	40,000

- How to Normalize feature “Distance”?
  - Computer mean and deviation  $\mu_{\text{dist}} = 256.25, \sigma_{\text{dist}} = 181.71$
  - Computer Z-Score for each sample (for example “Virgo”)

$$z_{\text{virgo, dist}} = \frac{x_{\text{virgo, dist}} - \mu_{\text{dist}}}{\sigma_{\text{dist}}} = \frac{15 - 256.25}{181.71} = -1.328$$

From lectures:

$$\beta^{\text{new}} = \beta^{\text{old}} - \left( \frac{\partial^2 L(\beta)}{\partial \beta \partial \beta^T} \right)^{-1} \frac{\partial L(\beta)}{\partial \beta}$$

Apply Newton's methods on single variable to find minima:

$$x_{n+1} = x_n - \frac{f'(x_n)}{f''(x_n)}$$

From single variable to Multivariate Newton-Raphson Method

1. Initialize  $x^{(0)}$
2. Calculate  $\nabla f(x)$
3. Calculate  $F(x)$
4. Initialize step  $n = 0$  and start loops
  - a. Calculate  $\nabla f(x^{(n)})$
  - b. Calculate  $F(x^{(n)})$
  - c. Calculate  $[F(x^{(n)})]^{-1}$
  - d. Update:  $x^{(n+1)} = x^{(n)} - [F(x^{(n)})]^{-1} \cdot \nabla f(x^{(n)})$
  - e. Update:  $n = n + 1$
5. Exit Loop

$$x^{(0)} = [3, -1, 0]$$

$$f(x_1, x_2, x_3) = (x_1 + 10x_2)^2 + 5(x_1 - x_3)^2 + (x_2 - 2x_3)^4$$

***Again, let's calculate on BOARD!***

$$x^{(0)} = [3, -1, 0]$$

$$f(x_1, x_2, x_3) = (x_1 + 10x_2)^2 + 5(x_1 - x_3)^2 + (x_2 - 2x_3)^4$$

## Newton's Method Example in one step:

- Calculate  $\nabla f(x^{(n)})$
- Calculate  $F(x^{(n)})$
- Calculate  $[F(x^{(n)})]^{-1}$
- Update:  $x^{(n+1)}$
- Update:  $n = n + 1$

$$\nabla f(x^{(0)}) = \left[ \frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \frac{\partial f}{\partial x_3} \right] = [16, -144, 22]$$

$$F(x^{(0)}) = \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \frac{\partial^2 f}{\partial x_1 \partial x_3} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \frac{\partial^2 f}{\partial x_2 \partial x_3} \\ \frac{\partial^2 f}{\partial x_3 \partial x_1} & \frac{\partial^2 f}{\partial x_3 \partial x_2} & \frac{\partial^2 f}{\partial x_3^2} \end{bmatrix} = \begin{bmatrix} 12 & 20 & -10 \\ 20 & 22 & -24 \\ -10 & -24 & 48 \end{bmatrix}$$

$$[F(x^{(0)})]^{-1} = \begin{bmatrix} -0.079 & 0.119 & 0.043 \\ 0.119 & -0.079 & -0.015 \\ 0.043 & -0.015 & 0.023 \end{bmatrix}$$

$$x^{(1)} = x^{(0)} - [F(x^{(0)})]^{-1} \cdot \nabla f(x^{(0)})$$

$$n = 1$$

Why do we need Stochastic GD besides the efficiency/scalability reason?

Think about saddle points and local minima.

We are given a data set consisting of the following experiment. Well, the dataset is a little bit small. (O\_o)

The height and weight of 3 people were recorded at the beginning of each person's 65th birthday. At exactly one year after each person's 65th birthday the vital status was recorded to be either alive or deceased.

Our end goal is to use logistic regression to predict the probability that a person's life expectancy is at least 66 years given their age of 65, initial vital status of alive, height, and weight (but we won't go that far here).

The data is given in the following table on the right.

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

Step 1: State the log-likelihood function.

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

**Step 1: State the log-likelihood function.**

Answer:

$$\alpha_1 = -b - 155w_1 - 60w_2$$

$$\alpha_2 = -b - 135w_1 - 64w_2$$

$$\alpha_3 = -b - 170w_1 - 73w_2$$

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

$$L = \log \left( 1 - \frac{1}{1 + e^{\alpha_1}} \right) + \log \left( \frac{1}{1 + e^{\alpha_2}} \right) + \log \left( \frac{1}{1 + e^{\alpha_3}} \right)$$

# UCLA Logistic Regression: Example Question

---

**Step 2: State the gradients for each parameter.**

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

**Step 2: State the gradients for each parameter.**

Answer:

$$L = \log \left( 1 - \frac{1}{1 + e^{\alpha_1}} \right) + \log \left( \frac{1}{1 + e^{\alpha_2}} \right) + \log \left( \frac{1}{1 + e^{\alpha_3}} \right)$$

$$\nabla_b = -1.0 \cdot \frac{1}{1 + e^{\alpha_1}} + -1.0 \cdot -\frac{e^{\alpha_2}}{1 + e^{\alpha_2}} + -1.0 \cdot -\frac{e^{\alpha_3}}{1 + e^{\alpha_3}}$$

$$\nabla_{w_1} = -155.0 \cdot \frac{1}{1 + e^{\alpha_1}} + -135.0 \cdot -\frac{e^{\alpha_2}}{1 + e^{\alpha_2}} + -170.0 \cdot -\frac{e^{\alpha_3}}{1 + e^{\alpha_3}}$$

$$\nabla_{w_2} = -60 \cdot \frac{1}{1 + e^{\alpha_1}} + -64.0 \cdot -\frac{e^{\alpha_2}}{1 + e^{\alpha_2}} + -73.0 \cdot -\frac{e^{\alpha_3}}{1 + e^{\alpha_3}}$$

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

$$\alpha_1 = -b - 155w_1 - 60w_2$$

$$\alpha_2 = -b - 135w_1 - 64w_2$$

$$\alpha_3 = -b - 170w_1 - 73w_2$$

# UCLA Logistic Regression: Example Question

**Step 3: Give the Hessian Matrix**

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

## Step 3: Give the Hessian Matrix

$$H_b^T = \begin{bmatrix} -1.0 \cdot -1.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -1.0 \cdot -1.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -1.0 \cdot -1.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -155.0 \cdot -1.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -135.0 \cdot -1.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -170.0 \cdot -1.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -60 \cdot -1.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -64.0 \cdot -1.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -73.0 \cdot -1.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \end{bmatrix}$$

$$\nabla_b = -1.0 \cdot \frac{1}{1+e^{\alpha_1}} + -1.0 \cdot -\frac{e^{\alpha_2}}{1+e^{\alpha_2}} + -1.0 \cdot -\frac{e^{\alpha_3}}{1+e^{\alpha_3}}$$

$$\nabla_{w_1} = -155.0 \cdot \frac{1}{1+e^{\alpha_1}} + -135.0 \cdot -\frac{e^{\alpha_2}}{1+e^{\alpha_2}} + -170.0 \cdot -\frac{e^{\alpha_3}}{1+e^{\alpha_3}}$$

$$\nabla_{w_2} = -60 \cdot \frac{1}{1+e^{\alpha_1}} + -64.0 \cdot -\frac{e^{\alpha_2}}{1+e^{\alpha_2}} + -73.0 \cdot -\frac{e^{\alpha_3}}{1+e^{\alpha_3}}$$

$$H_{w_1}^T = \begin{bmatrix} -1.0 \cdot -155.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -1.0 \cdot -135.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -1.0 \cdot -170.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -155.0 \cdot -155.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -135.0 \cdot -135.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -170.0 \cdot -170.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -60 \cdot -155.0 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -64.0 \cdot -135.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -73.0 \cdot -170.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \end{bmatrix}$$

$$H_{w_2}^T = \begin{bmatrix} -1.0 \cdot -60 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -1.0 \cdot -64.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -1.0 \cdot -73.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -155.0 \cdot -60 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -135.0 \cdot -64.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -170.0 \cdot -73.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \\ -60 \cdot -60 \cdot -\frac{e^{\alpha_1}}{(1+e^{\alpha_1})^2} + -64.0 \cdot -64.0 \cdot -\frac{e^{\alpha_2}}{(1+e^{\alpha_2})^2} + -73.0 \cdot -73.0 \cdot -\frac{e^{\alpha_3}}{(1+e^{\alpha_3})^2} \end{bmatrix}$$

**Step 4: Assuming an initial guess of 0.25 for each parameter, write python code for finding the values of the parameters after 2 iterations using the Newton Raphson method.**

$$b = 1.1346728128592689$$

$$w_1 = -2.4878423877892759$$

$$w_2 = 3.8192554544178936$$

Height (inches)	Weight (lbs)	Vital Status
60	155	Deceased
64	135	Alive
73	170	Alive

- Is likelihood a density or probability?
  - No, it is the multiplication of densities
- Log-likelihood used in gradient method
  - Logarithm is a strictly increasing function
  - Avoid product of probabilities underflow
  - Easier to take partial derivative than multiplication of probabilities
- Examples → Maximum Likelihood on Poisson Distribution

$$\log(x \cdot y) = \log(x) + \log(y)$$

$$P(X = x) = \frac{\lambda^x e^{-\lambda}}{x!}$$

- Is likelihood a density or probability?
  - No, it is the multiplication of densities
- Log-likelihood used in gradient method

  'text': 'u'I love this place! My fiance And I go here atleast once a week. The portions are huge! Food is amazing. I love their carne asada. They have great lunch specials... Leticia is super nice and cares about what you think of her restaurant. You have to try their cheese enchiladas too the sauce is different And amazing!!!',

  'text': 'u'I have to write a review on the Fractured Prune. First off I love doughnuts second I used to work in a bakery. So I know a little about the almighty doughnut. I was there this past Thursday night at Westgate where I was having a nice dinner at Opah Life. I wanted a little desert so I went to this doughnut shop it seemed clean enough so I made my selections and took them home. Mistake should have eaten one there I would have ask for my money back. I took a bite out of each on to confirm what I thought they were the worst doughnuts I have ever had. Horrible not sure if the oils was rancid or not hot enough either way eat at your own risk.',

**Evaluation metrics:** RMSE (Root-mean-square error) between ground truth ratings and predicted ratings between user-business pair.

**Formula:**

$$\text{RMSE} = \sqrt{\frac{1}{N} \sum_{i=1}^N (y_i - \hat{y}_i)^2}$$

- Data is in various types including **text data, binary features, numerical features, categorical features, etc.**
- If you consider friendship among users, it naturally constructs a “*user graph*”.
- If you consider business in same area, it also forms another “*business map*” based on geographic relations.
- There are temporal-related features on reviews.
- Some features of users and business are missing.
  - For example, some users do not have friends.
  - Some business attributes, hours or neighborhood are unknown.
- **Not all information are useful! → Some features may not be helpful for rating tasks.**
- **Try to start simple models. Sometimes they surprisingly work.**

- What is feature engineering?
  - Wikipedia: The process of using **domain knowledge** of the data to **create features** that make machine learning algorithms work.
- Reason for feature engineering
  - Simpler models / Better results
- When to apply feature engineering
  - Data collection → Data cleaning → **Feature Engineering** → Model Training → Evaluation
- Examples
  - [Speech recognition](#): Use Fourier transform to analyze spectrum instead of time series
  - Many other applications ...
- Methods: **Selection / Construction / Representation**
  - Example: Indicator variables
  - [More feature engineering methods](#)
- Advanced topic: Automated feature engineering

Sampled Digital Signal

- Numpy: A fundamental package for scientific computing with Python. It has following functions
  - Operations of N-dimensional array object (matrix, tensor)
  - Useful linear algebra, mathematical transform, and random number capabilities
- Pandas: Provide high-performance, easy-to-use data structures and data analysis toolkit for the Python language
- Installation Guide: [→ Install numpy](#) [→ Install pandas](#)
- Tutorials: [→ numpy quickstart](#) [→ pandas tutorial](#)
- Cheatsheet: [→ numpy cheatsheet](#) [→ pandas cheatsheet](#)

- What do you need from `numpy` and `pandas` in homework?

pandas

$$y_{it} = \beta' x_{it} + \mu_i + \epsilon_{it}$$

**NumPy :**

- (1) How to create/initialize a numpy array/matrix object
- (2) Dimensions of numpy array
- (3) Basic operations of numpy array (add, subtract, product, etc)
- (4) Indexing, slicing and stacking different arrays
- (5) Broadcasting rule

**Pandas :**

- (1) How to load data from file
- (2) How data is stored in DataFrame?
- (3) How to read and write data by index in DataFrame?
- (4) Iterating over a pandas DataFrame

UCLA

Thank you!

*Enjoy "mining" and good luck!*
