

## Homework 7: Kanga → MIPS

Grammars for Kanga and MIPS in JavaCC notation are on the CS 352 webpage.

Use JTB/GJ and JavaCC and write in Java one or more visitors which compile a Kanga program to MIPS.

Your main file should be called `K2M.java`, and if `P.kg` contains a *syntactically* correct Kanga program, then

```
java K2M < P.kg > P.s
```

creates a MIPS program `P.s` with the same behavior as `P.kg`.
