RESEARCH INTERESTS

My research is in machine learning, with a focus on developing and analyzing nonconvex optimization algorithms for machine learning to understand large-scale, dynamic, complex, and multi-modal data, and build the foundations of deep learning and reinforcement learning. Recently, I aim to advance foundation models, including (1) using mixture-of-experts (MoE) layer, mix-up, and sharpness-aware minimization (SAM) techniques to train foundation models (e.g., GPT3, BERT, and Vision Transformer); and (2) representation learning (e.g., self-supervised learning, few-shot and zero-shot learning, meta learning, self-training, learning with out-of-distribution (OOD), CLIP). On the other hand, I use AI to develop next-generation NoSQL databases and empower scientific discovery in domains such as biology, medicine, chemistry, and public health.
