# CS6220: DATA MINING TECHNIQUES 

## Chapter 2: Getting to Know Your Data

# Instructor: Yizhou Sun 

yzsun@ccs.neu.edu

January 8, 2013

## Chapter 2: Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

## Types of Data Sets

- Record
- Relational records
- Data matrix, e.g., numerical matrix, crosstabs
- Document data: text documents: termfrequency vector
- Transaction data
- Graph and network
- World Wide Web
- Social or information networks

|  | $\begin{aligned} & \text { त्0 } \\ & \stackrel{\cong}{3} \end{aligned}$ | $\begin{aligned} & \stackrel{3}{2} \\ & \stackrel{2}{3} \end{aligned}$ | $<\frac{\square}{\sim}$ | $\stackrel{\text { O}}{\underline{0}}$ | $\begin{aligned} & \text { n } \\ & \stackrel{0}{0} \end{aligned}$ |  | > | $\begin{aligned} & \overline{0} \\ & 0, \end{aligned}$ | $\begin{aligned} & \text { 菏 } \\ & \stackrel{\rightharpoonup}{0} \\ & \stackrel{\square}{7} \end{aligned}$ | N 0 0 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Document 1 | 3 | 0 | 5 | 0 | 2 | 6 | 0 | 2 | 0 | 2 |
| Document 2 | 0 | 7 | 0 | 2 | 1 | 0 | 0 | 3 | 0 | 0 |
| Document 3 | 0 | 1 | 0 | 0 | 1 | 2 | 2 | 0 | 3 | 0 |

- Molecular Structures
- Ordered
- Video data: sequence of images
- Temporal data: time-series
- Sequential Data: transaction sequences
- Genetic sequence data
- Spatial, image and multimedia:

| TID | Items |
| :--- | :--- |
| 1 | Bread, Coke, Milk |
| 2 | Beer, Bread |
| 3 | Beer, Coke, Diaper, Milk |
| 4 | Beer, Bread, Diaper, Milk |
| 5 | Coke, Diaper, Milk |

- Spatial data: maps
- Image data:
- Video data:

## Data Objects

- Data sets are made up of data objects.
- A data object represents an entity.
- Examples:
- sales database: customers, store items, sales
- medical database: patients, treatments
- university database: students, professors, courses
- Also called samples, examples, instances, data points, objects, tuples.
- Data objects are described by attributes.
- Database rows -> data objects; columns ->attributes.

## Attributes

- Attribute (or dimensions, features, variables): a data field, representing a characteristic or feature of a data object.
- E.g., customer_ID, name, address
- Types:
- Nominal
- Binary
- Ordinal
- Numeric: quantitative
- Interval-scaled
- Ratio-scaled

## Attribute Types

- Nominal: categories, states, or "names of things"
- Hair_color = \{auburn, black, blond, brown, grey, red, white\}
- marital status, occupation, ID numbers, zip codes
- Binary
- Nominal attribute with only 2 states (0 and 1 )
- Symmetric binary: both outcomes equally important
- e.g., gender
- Asymmetric binary: outcomes not equally important.
- e.g., medical test (positive vs. negative)
- Convention: assign 1 to most important outcome (e.g., HIV positive)
- Ordinal
- Values have a meaningful order (ranking) but magnitude between successive values is not known.
- Size $=\{$ small, medium, large $\}$, grades, army rankings

## Numeric Attribute Types

- Quantity (integer or real-valued)
- Interval
- Measured on a scale of equal-sized units
- Values have order
- E.g., temperature in $C^{\circ}$ or $F^{\circ}$, calendar dates
- No true zero-point
- We can evaluate the difference of two values, but one value cannot be a multiple of another
- Ratio
- Inherent zero-point
- We can speak of values as being an order of magnitude larger than the unit of measurement ( $10 \mathrm{~K}^{\circ}$ is twice as high as $5 \mathrm{~K}^{\circ}$ ).
- e.g., temperature in Kelvin, length, counts, monetary quantities

## Discrete vs. Continuous Attributes

## - Discrete Attribute

- Has only a finite or countably infinite set of values
- E.g., zip codes, profession, or the set of words in a collection of documents
- Sometimes, represented as integer variables
- Note: Binary attributes are a special case of discrete attributes
- Continuous Attribute
- Has real numbers as attribute values
- E.g., temperature, height, or weight
- Practically, real values can only be measured and represented using a finite number of digits
- Continuous attributes are typically represented as floating-point variables

## Chapter 2: Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

## Basic Statistical Descriptions of Data

- Central Tendency
- Dispersion of the Data
- Graphic Displays

## Measuring the Central Tendency

- Mean (algebraic measure) (sample vs. population):

Note: $n$ is sample size and $N$ is population size.

- Weighted arithmetic mean:
- Trimmed mean: chopping extreme values

## - Median:

$$
\begin{aligned}
& \bar{x}=\frac{1}{n} \sum_{i=1}^{n} x_{i} \quad \mu=\frac{\sum x}{N} \\
& \bar{x}=\frac{\sum_{i=1}^{n} w_{i} x_{i}}{\sum_{i=1}^{n} w_{i}}
\end{aligned}
$$

- Middle value if odd number of values, or average of the middle two values otherwise
- Estimated by interpolation (for grouped data):
- Mode

$$
\text { median }=L_{1}+\left(\frac{n / 2-\left(\sum \text { freq }\right) l}{\text { freq }_{\text {median }}}\right) \text { width }
$$

| age | frequency |
| :--- | :---: |
| $1-5$ | 200 |
| $6-15$ | 450 |
| $16-20$ | 300 |
| $21-50$ | 1500 |
| $51-80$ | 700 |
| $81-110$ | 44 |

- Unimodal, bimodal, trimodal

$$
\text { mean }- \text { mode }=3 \times(\text { mean }- \text { median })
$$

## Symmetric vs. Skewed Data

- Median, mean and mode of symmetric, positively and negatively skewed data

symmetric

## Measuring the Dispersion of Data

- Quartiles, outliers and boxplots
- Quartiles: $\mathrm{Q}_{1}$ ( $25^{\text {th }}$ percentile), $\mathrm{Q}_{3}$ ( $75^{\text {th }}$ percentile)
- Inter-quartile range: $I Q R=Q_{3}-Q_{1}$
- Five number summary: $\min , Q_{1}$, median, $Q_{3}$, max
- Boxplot: ends of the box are the quartiles; median is marked; add whiskers, and plot outliers individually
- Outlier: usually, a value higher/lower than $1.5 \times$ IQR
- Variance and standard deviation (sample: s, population: $\sigma$ )
- Variance: (algebraic, scalable computation)

$$
s^{2}=\frac{1}{n-1} \sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}=\frac{1}{n-1}\left[\sum_{i=1}^{n} x_{i}^{2}-\frac{1}{n}\left(\sum_{i=1}^{n} x_{i}\right)^{2}\right] \quad \sigma^{2}=\frac{1}{N} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}=\frac{1}{N} \sum_{i=1}^{n} x_{i}^{2}-\mu^{2}
$$

- Standard deviation $s(o r \sigma)$ is the square root of variance $s^{2}\left(o r \sigma^{2)}\right.$

## Boxplot Analysis

- Five-number summary of a distribution

- Minimum, Q1, Median, Q3, Maximum

## - Boxplot

- Data is represented with a box
- The ends of the box are at the first and third quartiles, i.e., the height of the box is IQR
- The median is marked by a line within the box
- Whiskers: two lines outside the box extended to Minimum and Maximum

- Outliers: points beyond a specified outlier threshold, plotted individually

## Visualization of Data Dispersion: 3-D Boxplots

## Properties of Normal Distribution Curve

- The normal (distribution) curve
- From $\mu-\sigma$ to $\mu+\sigma$ : contains about $68 \%$ of the measurements ( $\mu$ : mean, $\sigma$ : standard deviation)
- From $\mu-2 \sigma$ to $\mu+2 \sigma$ : contains about $95 \%$ of it
- From $\mu-3 \sigma$ to $\mu+3 \sigma$ : contains about $99.7 \%$ of it

## Graphic Displays of Basic Statistical Descriptions

- Boxplot: graphic display of five-number summary
- Histogram: x-axis are values, y-axis repres. frequencies
- Quantile plot: each value $x_{i}$ is paired with $f_{i}$ indicating that approximately $100 f_{i} \%$ of data are $\leq x_{i}$
- Quantile-quantile (q-q) plot: graphs the quantiles of one univariant distribution against the corresponding quantiles of another
- Scatter plot: each pair of values is a pair of coordinates and plotted as points in the plane

## Histogram Analysis

- Histogram: Graph display of tabulated frequencies, shown as bars
- It shows what proportion of cases fall into each of several categories
- Differs from a bar chart in that it is the area of the bar that denotes the value, not the height as in bar charts, a crucial distinction when the categories are not of uniform width
- The categories are usually specified as non-overlapping intervals of some variable. The categories (bars) must be
 adjacent

## Histograms Often Tell More than Boxplots

- The two histograms shown in the left may have the same boxplot representation
- The same values for: min, Q1, median, Q3, max
- But they have rather different data distributions

## Quantile Plot

- Displays all of the data (allowing the user to assess both the overall behavior and unusual occurrences)
- Plots quantile information
- For a data $x_{i}$ data sorted in increasing order, $f_{i}$ indicates that approximately $100 f_{i} \%$ of the data are below or equal to the value $x_{i}$

f-value

## Quantile-Quantile (Q-Q) Plot

- Graphs the quantiles of one univariate distribution against the corresponding quantiles of another
- View: Is there is a shift in going from one distribution to another?
- Example shows unit price of items sold at Branch 1 vs. Branch 2 for each quantile. Unit prices of items sold at Branch 1 tend to be lower than those at Branch 2.

## Scatter plot

- Provides a first look at bivariate data to see clusters of points, outliers, etc
- Each pair of values is treated as a pair of coordinates and plotted as points in the plane

## Positively and Negatively Correlated Data

## Uncorrelated Data

## Chapter 2: Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

## Data Visualization

-Why data visualization?

- Gain insight into an information space by mapping data onto graphical primitives
- Provide qualitative overview of large data sets
- Search for patterns, trends, structure, irregularities, relationships among data
- Help find interesting regions and suitable parameters for further quantitative analysis
- Provide a visual proof of computer representations derived

## Direct Data Visualization

## 

## 3D Scatter Plot

## Scatterplot Matrices

Matrix of scatterplots ( $x-y$-diagrams) of the $k$-dim. data [total of (k2/2-k) scatterplots]

## Landscapes

news articles
visualized as
a landscape

- Visualization of the data as perspective landscape
- The data needs to be transformed into a (possibly artificial) 2D spatial representation which preserves the characteristics of the data

## Parallel Coordinates

- n equidistant axes which are parallel to one of the screen axes and correspond to the attributes
- The axes are scaled to the [minimum, maximum]: range of the corresponding attribute
- Every data item corresponds to a polygonal line which intersects each of the axes at the point which corresponds to the value for the attribute

## Parallel Coordinates of a Data Set

## Visualizing Text Data

## - Tag cloud: visualizing user-generated tags

- The importance of tag is represented by font size/color

Newsmap: Google News Stories in 2005

## Visualizing Social/Information Networks

Computer Science Conference Network

## Chapter 2: Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

## Similarity and Dissimilarity

- Similarity
- Numerical measure of how alike two data objects are
- Value is higher when objects are more alike
- Often falls in the range [0,1]
- Dissimilarity (e.g., distance)
- Numerical measure of how different two data objects are
- Lower when objects are more alike
- Minimum dissimilarity is often 0
- Upper limit varies
- Proximity refers to a similarity or dissimilarity

## Data Matrix and Dissimilarity Matrix

- Data matrix
- n data points with p dimensions
- Two modes

$$
\left[\begin{array}{ccccc}
x_{11} & \ldots & x_{1 f} & \ldots & x_{1 p} \\
\ldots & \ldots . & \ldots & \ldots & \ldots \\
x_{i 1} & \ldots & x_{i f} & \ldots & x_{i p} \\
\ldots & \ldots & \ldots & \ldots & \ldots \\
x_{n 1} & \ldots & x_{n f} & \ldots & x_{n p}
\end{array}\right]
$$

- Dissimilarity matrix
- n data points, but registers only the distance
- A triangular matrix
- Single mode
$\left[\begin{array}{ccccc}0 & & & & \\ d(2,1) & 0 & & & \\ d(3,1) & d(3,2) & 0 & & \\ : & : & : & & \\ d(n, 1) & d(n, 2) & \ldots & \ldots & 0\end{array}\right]$

## Proximity Measure for Nominal Attributes

- Can take 2 or more states, e.g., red, yellow, blue, green (generalization of a binary attribute)
- Method 1: Simple matching
- m: \# of matches, p: total \# of variables

$$
d(i, j)=\frac{p-m}{p}
$$

- Method 2: Use a large number of binary attributes
- creating a new binary attribute for each of the $M$ nominal states

## Proximity Measure for Binary Attributes

- A contingency table for binary data

|  | Object $j$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | 0 | sum |
| Object $i$ | 1 | $q$ | $r$ | $q+r$ |
| ary | 0 | $s$ | $t$ | $s+t$ |
|  | sum | $q+s$ | $r+t$ | $p$ |

- Distance measure for symmetric binary variables:

$$
d(i, j)=\frac{r+s}{q+r+s+t}
$$

- Distance measure for asymmetric binary

$$
d(i, j)=\frac{r+s}{q+r+s}
$$

- Jaccard coefficient (similarity measure for asymmetric binary variables):

$$
\operatorname{sim}_{J a c c a r d}(i, j)=\frac{q}{q+r+s}
$$

- Note: J accard coefficient is the same as "coherence":

$$
\operatorname{coherence}(i, j)=\frac{\sup (i, j)}{\sup (i)+\sup (j)-\sup (i, j)}=\frac{q}{(q+r)+(q+s)-q}
$$

## Dissimilarity between Binary Variables

- Example

| Name | Gender | Fever | Cough | Test-1 | Test-2 | Test-3 | Test-4 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Jack | M | Y | N | P | N | N | N |
| Mary | F | Y | N | P | N | P | N |
| Jim | M | Y | P | N | N | N | N |

- Gender is a symmetric attribute
- The remaining attributes are asymmetric binary
- Let the values Y and P be 1 , and the value N 0

$$
\begin{aligned}
& d(\text { jack, mary })=\frac{0+1}{2+0+1}=0.33 \\
& d(\text { jack, jim })=\frac{1+1}{1+1+1}=0.67 \\
& d(\text { jim }, \text { mary })=\frac{1+2}{1+1+2}=0.75
\end{aligned}
$$

## Standardizing Numeric Data

- z -score: $\quad \mathrm{z}=\frac{x-\mu}{\sigma}$
- X: raw score to be standardized, $\mu$ : mean of the population, $\sigma$ : standard deviation
- the distance between the raw score and the population mean in units of the standard deviation
- negative when the raw score is below the mean, " + " when above
- An alternative way: Calculate the mean absolute deviation

$$
\begin{aligned}
& \quad s_{f}=\frac{1}{n}\left(\left|x_{1 f}-m_{f}\right|+\left|x_{2 f}-m_{f}\right|+\ldots+\left|x_{n f}-m_{f}\right|\right) \\
& \text { where } \quad m_{f}=\frac{1}{n}\left(x_{1 f}+x_{2 f}+\ldots+x_{n f}\right) . \\
& \text { - standardized measure ( } z \text {-score): }
\end{aligned} z_{i f}=\frac{x_{i f}-m_{f}}{S_{f}} .
$$

where

- Using mean absolute deviation is more robust than using standard deviation

# Example: <br> Data Matrix and Dissimilarity Matrix 

Data Matrix

| point | attribute1 | attribute2 |
| :---: | :---: | :---: |
| $\boldsymbol{x} \mathbf{1}$ | 1 | 2 |
| $\boldsymbol{x} \mathbf{2}$ | 3 | 5 |
| $\boldsymbol{x} \mathbf{3}$ | 2 | 0 |
| $\boldsymbol{x} \mathbf{4}$ | 4 | 5 |

## Dissimilarity Matrix

## (with Euclidean Distance)

|  | $\boldsymbol{x 1}$ | $\boldsymbol{x} \mathbf{2}$ | $\boldsymbol{x} 3$ | $\boldsymbol{x} \mathbf{4}$ |
| :--- | ---: | ---: | ---: | ---: |
| $\boldsymbol{x} \mathbf{1}$ | 0 |  |  |  |
| $\boldsymbol{x} \mathbf{2}$ | 3.61 | 0 |  |  |
| $\boldsymbol{x} \mathbf{3}$ | 2.24 | 5.1 | 0 |  |
| $\boldsymbol{x} \mathbf{4}$ | 4.24 | 1 | 5.39 | 0 |

## Distance on Numeric Data: Minkowski Distance

- Minkowski distance: A popular distance measure

$$
d(i, j)=\sqrt[h]{\left|x_{i 1}-x_{j 1}\right|^{h}+\left|x_{i 2}-x_{j 2}\right|^{h}+\cdots+\left|x_{i p}-x_{j p}\right|^{h}}
$$

where $i=\left(x_{\mathrm{i} 1}, x_{\mathrm{i} 2}, \ldots, x_{\mathrm{ip}}\right)$ and $j=\left(x_{\mathrm{j} 1}, x_{\mathrm{j} 2}, \ldots, x_{\mathrm{jp}}\right)$ are two $p$ dimensional data objects, and $h$ is the order (the distance so defined is also called L -h norm)

- Properties
- $\mathrm{d}(\mathrm{i}, \mathrm{j})>0$ if $\mathrm{i} \neq \mathrm{j}$, and $\mathrm{d}(\mathrm{i}, \mathrm{i})=0$ (Positive definiteness)
- $\mathrm{d}(\mathrm{i}, \mathrm{j})=\mathrm{d}(\mathrm{j}, \mathrm{i}) \quad$ (Symmetry)
- $\mathrm{d}(\mathrm{i}, \mathrm{j}) \leq \mathrm{d}(\mathrm{i}, \mathrm{k})+\mathrm{d}(\mathrm{k}, \mathrm{j}) \quad$ (Triangle Inequality)
- A distance that satisfies these properties is a metric

## Special Cases of Minkowski Distance

- $h=1$ : Manhattan (city block, $\mathrm{L}_{1}$ norm) distance
- E.g., the Hamming distance: the number of bits that are different between two binary vectors

$$
d(i, j)=\left|x_{i_{1}}-x_{j_{1}}\right|+\left|x_{i_{2}}-x_{j_{2}}\right|+\ldots+\left|x_{i_{p}}-x_{j_{p}}\right|
$$

- $h=2:\left(\mathrm{L}_{2}\right.$ norm) Euclidean distance

$$
d(i, j)=\sqrt{\left(\left|x_{i_{1}}-x_{j_{1}}\right|^{2}+\left|x_{i_{2}}-x_{j_{2}}\right|^{2}+\ldots+\left|x_{i_{p}}-x_{j_{p}}\right|^{2}\right)}
$$

- $h \rightarrow \infty$. "supremum" ( $\mathrm{L}_{\text {max }}$ norm, $\mathrm{L}_{\infty}$ norm) distance.
- This is the maximum difference between any component (attribute) of the vectors

$$
d(i, j)=\lim _{h \rightarrow \infty}\left(\sum_{f=1}^{p}\left|x_{i f}-x_{j f}\right|^{h}\right)^{\frac{1}{h}}=\max _{f}^{p}\left|x_{i f}-x_{j f}\right|
$$

## Example: Minkowski Distance

## Dissimilarity Matrices

| point | attribute 1 | attribute 2 |
| :---: | :---: | :---: |
| $\mathbf{x 1}$ | 1 | 2 |
| $\mathbf{x} 2$ | 3 | 5 |
| $\mathbf{x 3}$ | 2 | 0 |
| $\mathbf{x 4}$ | 4 | 5 |

## Manhattan ( $\mathrm{L}_{1}$ )

| $\mathbf{L}$ | $\mathbf{x} 1$ | $\mathbf{x 2}$ | $\mathbf{x 3}$ | $\mathbf{x 4}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{x} \mathbf{1}$ | 0 |  |  |  |
| $\mathbf{x 2}$ | 5 | 0 |  |  |
| $\mathbf{x 3}$ | 3 | 6 | 0 |  |
| $\mathbf{x 4}$ | 6 | 1 | 7 | 0 |

Euclidean ( $\mathrm{L}_{2}$ )

| $\mathbf{L 2}$ | $\mathbf{~} 1 \mathbf{1}$ | $\mathbf{x 2}$ | $\mathbf{x 3}$ | $\mathbf{x 4}$ |
| :---: | ---: | ---: | ---: | ---: |
| $\mathbf{x 1}$ | 0 |  |  |  |
| $\mathbf{x 2}$ | 3.61 | 0 |  |  |
| $\mathbf{x 3}$ | 2.24 | 5.1 | 0 |  |
| $\mathbf{x 4}$ | 4.24 | 1 | 5.39 | 0 |

## Supremum

| $\mathbf{L}_{\infty}$ | $\mathbf{x 1}$ | $\mathbf{x} 2$ | $\mathbf{x 3}$ | $\mathbf{x 4}$ |
| :---: | ---: | ---: | ---: | ---: |
| $\mathbf{x 1}$ | 0 |  |  |  |
| $\mathbf{x} \mathbf{2}$ | 3 | 0 |  |  |
| $\mathbf{x 3}$ | 2 | 5 | 0 |  |
| $\mathbf{x 4}$ | 3 | 1 | 5 | 0 |

## Ordinal Variables

- An ordinal variable can be discrete or continuous
- Order is important, e.g., rank
- Can be treated like interval-scaled
- replace $x_{i f}$ by their rank

$$
r_{i f} \in\left\{1, \ldots, M_{f}\right\}
$$

- map the range of each variable onto [0, 1] by replacing $i$-th object in the $f$-th variable by

$$
z_{i f}=\frac{r_{i f}-1}{M_{f}-1}
$$

- compute the dissimilarity using methods for interval-scaled variables

## Attributes of Mixed Type

- A database may contain all attribute types
- Nominal, symmetric binary, asymmetric binary, numeric, ordinal
- One may use a weighted formula to combine their effects

$$
d(i, j)=\frac{\sum_{f=1}^{p} \delta_{i j}^{(f)} d_{i j}^{(f)}}{\sum_{f=1}^{p} \delta_{i j}^{(f)}}
$$

- $f$ is binary or nominal:
$d_{i j}{ }^{(f)}=0$ if $\mathrm{x}_{\mathrm{if}}=\mathrm{x}_{\mathrm{jf}}$, or $\mathrm{d}_{\mathrm{ij}}^{(\mathrm{ff})}=1$ otherwise
- $f$ is numeric: use the normalized distance
- $f$ is ordinal
- Compute ranks $\mathrm{r}_{\text {if }}$ and
- Treat $\mathrm{z}_{\mathrm{if}}$ as interval-scaled

$$
z_{i f}=\frac{r_{i f}-1}{M_{f}-1}
$$

## Cosine Similarity

- A document can be represented by thousands of attributes, each recording the frequency of a particular word (such as keywords) or phrase in the document.

| Document | team coach | hockey | baseball | soccer | penalty | score | win | loss | season |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Document1 | 5 | 0 | 3 | 0 | 2 | 0 | 0 | 2 | 0 | 0 |
| Document2 | 3 | 0 | 2 | 0 | 1 | 1 | 0 | 1 | 0 | 1 |
| Document3 | 0 | 7 | 0 | 2 | 1 | 0 | 0 | 3 | 0 | 0 |
| Document4 | 0 | 1 | 0 | 0 | 1 | 2 | 2 | 0 | 3 | 0 |

- Other vector objects: gene features in micro-arrays, ...
- Applications: information retrieval, biologic taxonomy, gene feature mapping, ...
- Cosine measure: If $d_{1}$ and $d_{2}$ are two vectors (e.g., term-frequency vectors), then

$$
\cos \left(d_{1}, d_{2}\right)=\left(d_{1} \bullet d_{2}\right) /\left\|d_{1}\right\|\left\|d_{2}\right\|
$$

where $\bullet$ indicates vector dot product, $||d||$ : the length of vector $d$

## Example: Cosine Similarity

- $\cos \left(d_{1}, d_{2}\right)=\left(d_{1} \bullet d_{2}\right) /\left\|d_{1}\right\|\left\|d_{2}\right\|$,
where $\bullet$ indicates vector dot product, $||d|$ : the length of vector $d$
- Ex: Find the similarity between documents 1 and 2.

$$
\begin{aligned}
& d_{1}=(5,0,3,0,2,0,0,2,0,0) \\
& d_{2}=(3,0,2,0,1,1,0,1,0,1) \\
& d_{1} \bullet d_{2}=5^{*} 3+0 *\left(0+3^{*} 2+0 *\left(0+2^{*} 1+0 * 1+0 * 1+2^{*} 1+0 *(0+0)^{*} 1=25\right.\right. \\
& \left|\left|d_{1}\right|\right|=\left(5^{*} 5+0 * 0+3^{*} 3+0 * 0+2^{*} 2+0 * 0+0 * 0+2^{*} 2+0{ }^{*} 0+0{ }^{*} 0\right)^{0.5=(42)^{0.5}=6.481} \\
& \left|\left|d_{2}\right|\right|=\left(3^{*} 3+0 *\left(0+2^{*} 2+0 * 0+1^{*} 1+1^{*} 1+0 *\left(0+1^{*} 1+0 * 0+1^{*} 1\right)^{0.5=(17)^{0.5}}=4.12\right.\right. \\
& \cos \left(d_{1}, d_{2}\right)=0.94
\end{aligned}
$$

## Chapter 2: Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

## Summary

- Data attribute types: nominal, binary, ordinal, interval-scaled, ratio-scaled
- Many types of data sets, e.g., numerical, text, graph, Web, image.
- Gain insight into the data by:
- Basic statistical data description: central tendency, dispersion, graphical displays
- Data visualization: map data onto graphical primitives
- Measure data similarity
- Above steps are the beginning of data preprocessing.
- Many methods have been developed but still an active area of research.
