# Why using Recommender Systems?

---

- Value for the customer
  - Find things that are interesting
  - Narrow down the set of choices
  - Help me explore the space of options
  - Discover new things
  - Entertainment
  - ...
- Value for the provider
  - Additional and probably unique personalized service for the customer
  - Increase trust and customer loyalty
  - Increase sales, click through rates, conversion etc.
  - Opportunities for promotion, persuasion
  - Obtain more knowledge about customers
  - ...

# Matrix Representation

- Sparse Matrix
  - Explicit Feedback

| Users | Movie1 | Movie2 | Movie3 | Movie4 | Movie5 | Movie6 | ... |
|-------|--------|--------|--------|--------|--------|--------|-----|
| User1 | ?      | ?      | 4      | ?      | 1      | ?      | ... |
| User2 | 2      | 5      | 2      | ?      | ?      | 2      | ... |
| User3 | ?      | ?      | 5      | 3      | 2      | 4      | ... |
| User4 | 1      | ?      | ?      | 4      | ?      | ?      | ... |
| User5 | 2      | 3      | ?      | ?      | ?      | ?      | ... |
| ...   | ...    | ...    | ...    | ...    | ...    | ...    | ... |

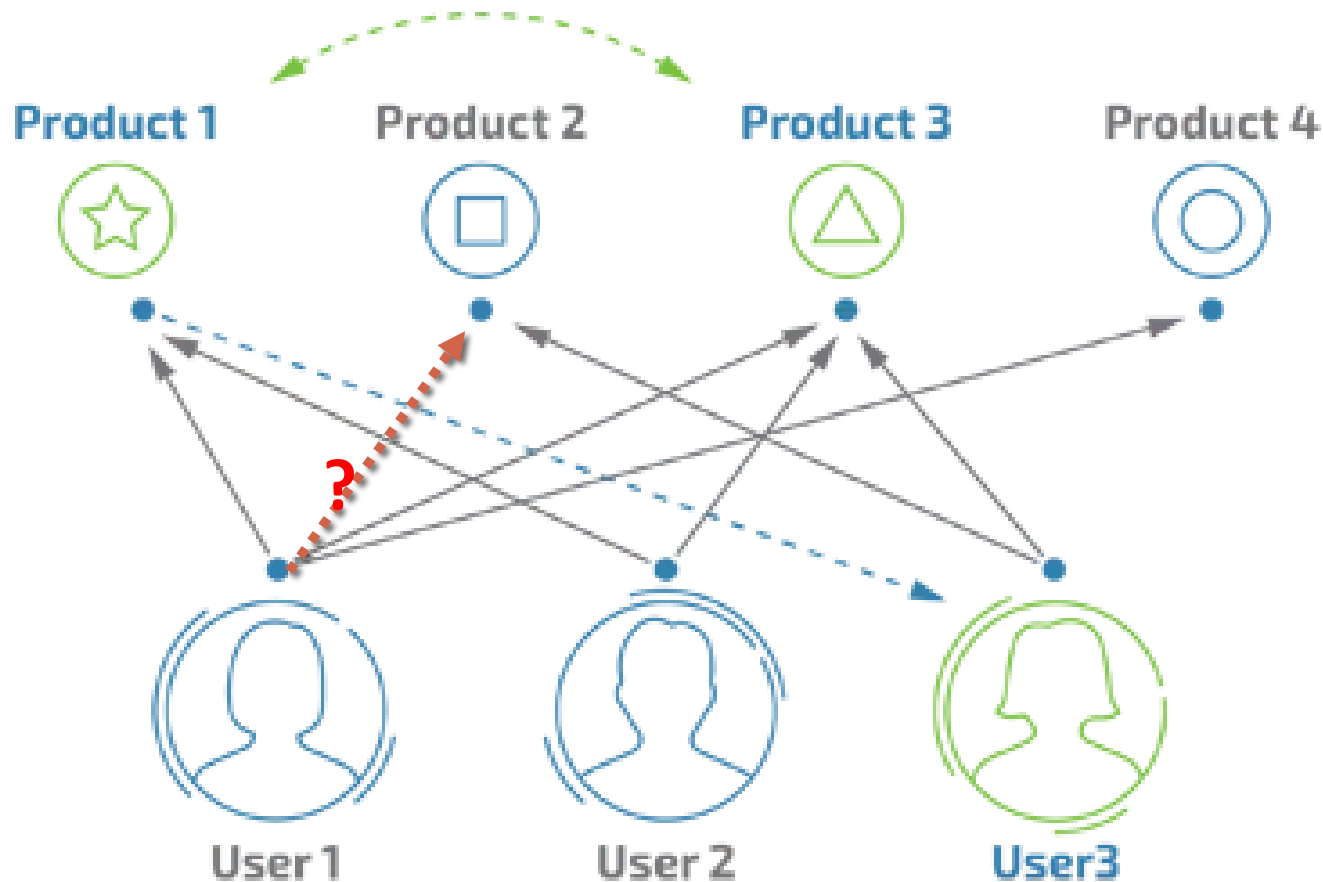

- **Implicit Feedback:** only know whether user and item has interacted

|       |       | Items   |  |   |   | ... |
|-------|-------|---|--|---|---|-----|
|       |       |  |  |  |  |     |
| Users | Alice | 1   | 1  | 0   | 0   |     |
|       | Bob   | 0   | 0  | 1   | 1   |     |
|       | Corey | 1   | 0  | 1   | 0   |     |
|       | ...   |   |  |   |   |     |

# A Network Point of View

- Link prediction problem

# Methods

---

- Collaborative filtering
- Content-based recommendation
- Hybrid methods

# Recommender Systems

---

- What is Recommender System?
- Collaborative Filtering 
- Content-based Recommendation
- Hybrid methods
- Evaluation Metrics
- Summary

# Collaborative Filtering (CF)

---

- The most prominent approach to generate recommendations
  - used by large, commercial e-commerce sites
  - well-understood, various algorithms and variations exist
  - applicable in many domains (book, movies, DVDs, ..)
- Approach
  - use the "wisdom of the crowd" to recommend items
- Basic assumption and idea
  - Users give ratings to catalog items (implicitly or explicitly)
  - Customers who had similar tastes in the past, will have similar tastes in the future

# Major Methods for CF

---

- Memory-based Collaborative Filtering
  - User-based CF
    - Compute similarity between users and active users, and use similar users' ratings as prediction
  - Item-based CF
    - Compute similarity between items, and predict similar rating to similar items that the active user has rated before
- Model-based Collaborative Filtering

# User-based Collaborative Filtering

---

1. Define similarity between users according to the history matrix
2. Decide how many “peers” to consider
3. Use peers’ ratings to predict the rating between an active user and an item

|       | Item1 | Item2 | Item3 | Item4 | Item5 |
|-------|-------|-------|-------|-------|-------|
| Alice | 5     | 3     | 4     | 4     | ?     |
| User1 | 3     | 1     | 2     | 3     | 3     |
| User2 | 4     | 3     | 4     | 3     | 5     |
| User3 | 3     | 3     | 1     | 5     | 4     |
| User4 | 1     | 5     | 5     | 2     | 1     |

# (1) Define Similarities between Users

---

- Pearson correlation between user a and b

$$sim(a, b) = \frac{\sum_{p \in P} (r_{a,p} - \bar{r}_a)(r_{b,p} - \bar{r}_b)}{\sqrt{\sum_{p \in P} (r_{a,p} - \bar{r}_a)^2} \sqrt{\sum_{p \in P} (r_{b,p} - \bar{r}_b)^2}}$$

- $r_{a,p}$ : rating of user a to item p
- $P$ : a set of items that are rated by both a and b
- $\bar{r}_a, \bar{r}_b$ : average rating of user a and b
- Or,  $sim(a, b) = \frac{cov(r_a, r_b)}{\sigma(r_a)\sigma(r_b)}$ 
  - $cov(r_a, r_b)$ : covariance between a and b
  - $\sigma(r_a), \sigma(r_b)$ : standard deviation of a and b

# Example

- $sim(Alice, User1)$

- $\overline{r_{Alice}} = \frac{5+3+4+4}{4} = 4; \sigma(Alice) = 0.707$

- $\overline{r_{User1}} = \frac{3+1+2+3}{4} = 2.25; \sigma(User1) = 0.9574$

- $cov(Alice, User1) = 0.6667;$

- $\Rightarrow sim(Alice, User1) = \frac{0.6667}{0.707 * 0.9574} = 0.8528$

|       | Item1 | Item2 | Item3 | Item4 | Item5 |
|-------|-------|-------|-------|-------|-------|
| Alice | 5     | 3     | 4     | 4     | ?     |
| User1 | 3     | 1     | 2     | 3     | 3     |
| User2 | 4     | 3     | 4     | 3     | 5     |
| User3 | 3     | 3     | 1     | 5     | 4     |
| User4 | 1     | 5     | 5     | 2     | 1     |

sim = 0.85  
sim = 0.70  
sim = -0.79

## (2) Decide how many peers to use

---

- Usually only use top  $K$  most similar users for prediction
  - i.e., based on top- $K$  most similar users' rating for an item

# (3) Predict the rating

---

- A common prediction function:

$$pred(a, p) = \bar{r}_a + \frac{\sum_{b \in N} sim(a, b) * (r_{b,p} - \bar{r}_b)}{\sum_{b \in N} sim(a, b)}$$

- Calculate, whether the neighbors' ratings for the unseen item  $i$  are higher or lower than their average
- Combine the rating differences – use the similarity as a weight
- Add/subtract the neighbors' bias from the active user's average and use this as a prediction

# Example

- Use top-2 neighbor for prediction

- Alice's top-2 neighbor are User1 and User2

- $$\text{pred}(\text{Alice}, \text{Item5}) = \overline{r_{\text{Alice}}} + \frac{\text{sim}(\text{Alice}, \text{User1})(r_{\text{User1}, \text{Item5}} - \overline{r_{\text{User1}}}) + \text{sim}(\text{Alice}, \text{User2})(r_{\text{User2}, \text{Item5}} - \overline{r_{\text{User2}}})}{\text{sim}(\text{Alice}, \text{User1}) + \text{sim}(\text{Alice}, \text{User2})}$$
$$= 4 + \frac{0.85 * (3 - 2.25) + 0.70 * (5 - 3.5)}{0.85 + 0.70} = 5.0887$$

|       | Item1 | Item2 | Item3 | Item4 | Item5 |
|-------|-------|-------|-------|-------|-------|
| Alice | 5     | 3     | 4     | 4     | ?     |
| User1 | 3     | 1     | 2     | 3     | 3     |
| User2 | 4     | 3     | 4     | 3     | 5     |
| User3 | 3     | 3     | 1     | 5     | 4     |
| User4 | 1     | 5     | 5     | 2     | 1     |

sim = 0.85  
sim = 0.70

# Model-based Collaborative Filtering

---

- User-based CF is said to be "memory-based"
  - the rating matrix is directly used to find neighbors / make predictions
  - does not scale for most real-world scenarios
  - large e-commerce sites have tens of millions of customers and millions of items
- Model-based approaches
  - based on an offline pre-processing or "model-learning" phase
  - at run-time, only the learned model is used to make predictions
  - models are updated / re-trained periodically
  - large variety of techniques used
  - model-building and updating can be computationally expensive

# Matrix Factorization for Recommendation

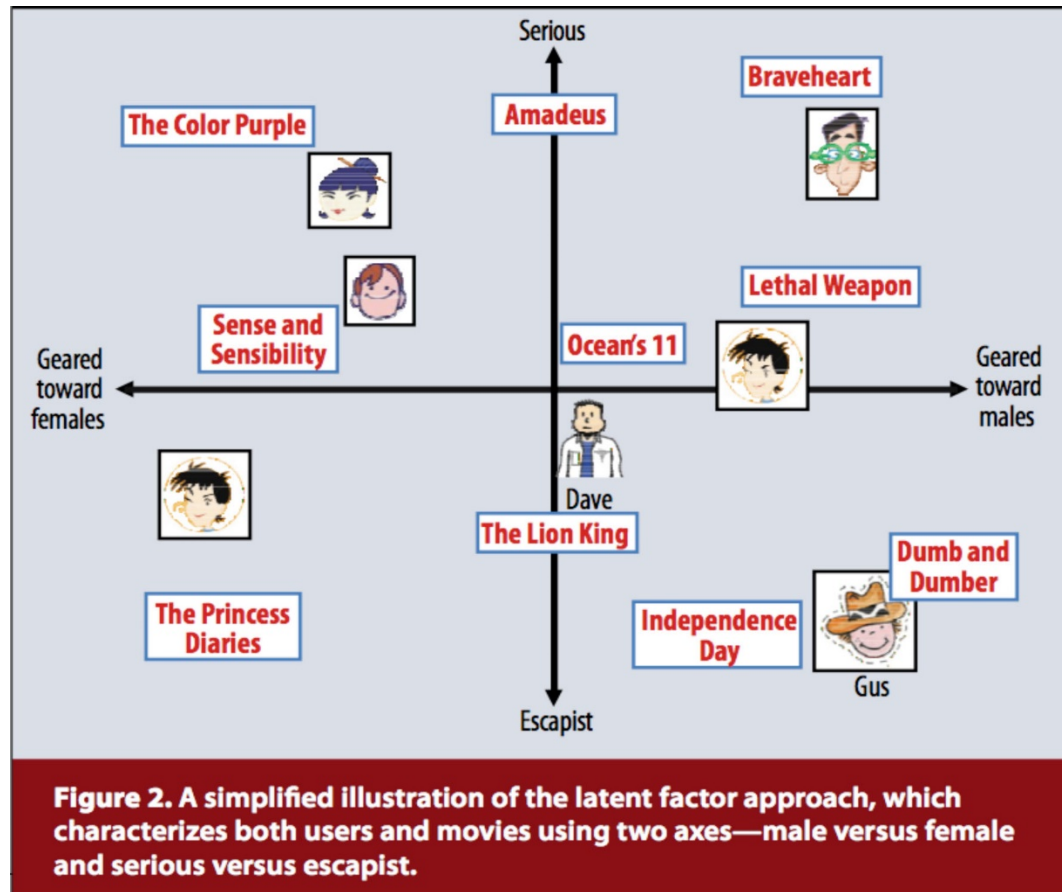

- Map users and items into the same latent space

Reference: Koren et al., "Matrix Factorization Techniques for Recommender System", *Computer* (Volume: 42, Issue: 8), 2009

# Now users and items are comparable

- Recommendation: find items that are close to users in the new space

# Procedure

---

- Training stage
  - Use existing matrix to learn the latent feature vector for both users and items by matrix factorization
- Recommendation stage
  - Predict the score for unknown (user, item) pairs

# Training Stage

- $r_{ui}$ : the rating from u to i
- $p_u$ : the latent feature vector for user u
- $q_i$ : the latent feature vector for item i
- $\hat{r}_{ui}$ : score function for (u,i),  $\hat{r}_{ui} = q_i^T p_u$
- Objective function:

$$\min_{p^*, q^*} \sum_{(u,i) \in D} (r_{ui} - q_i^T p_u)^2 + \lambda (\|q_i\|^2 + \|p_u\|^2)$$

|      |   | Item          |     |     |             |   |         |  |
|------|---|---------------|-----|-----|-------------|---|---------|--|
|      |   | W             | X   | Y   | Z           |   |         |  |
| User | A |               | 4.5 | 2.0 |             | A | 1.2 0.8 |  |
|      | B | 4.0           |     | 3.5 |             | B | 1.4 0.9 |  |
|      | C |               | 5.0 |     | 2.0         | C | 1.5 1.0 |  |
|      | D |               | 3.5 | 4.0 | 1.0         | D | 1.2 0.8 |  |
|      |   | Rating Matrix |     |     |             | = |         |  |
|      |   | User Matrix   |     | X   | Item Matrix |   |         |  |

# Learning Algorithm

---

- Stochastic gradient descent
- For each rating (u, i):
  - *update*  $p_u$ :  $p_u \leftarrow p_u + \eta \cdot ((r_{ui} - \hat{r}_{ui})q_i - \lambda p_u)$
  - *update*  $q_i$ :  $q_i \leftarrow q_i + \eta \cdot ((r_{ui} - \hat{r}_{ui})p_u - \lambda q_i)$
- Where  $\eta$  is the learning rate

# Prediction Stage

- For an unseen pair (u, i)
  - $\hat{r}_{ui} = q_i^T p_u = p_u^T q_i$
- Example:
  - $r_{AW} = p_A^T q_W = 1.2 * 1.5 + 0.8 * 1.7 = 3.16$

|      |   | Item |     |     |     |
|------|---|------|-----|-----|-----|
|      |   | W    | X   | Y   | Z   |
| User | A |      | 4.5 | 2.0 |     |
|      | B | 4.0  |     | 3.5 |     |
|      | C |      | 5.0 |     | 2.0 |
|      | D |      | 3.5 | 4.0 | 1.0 |

Rating Matrix

=

| A | 1.2 | 0.8 |
|---|-----|-----|
| B | 1.4 | 0.9 |
| C | 1.5 | 1.0 |
| D | 1.2 | 0.8 |

User Matrix

X

|  |  | W   | X   | Y   | Z   |
|--|--|-----|-----|-----|-----|
|  |  | 1.5 | 1.2 | 1.0 | 0.8 |
|  |  | 1.7 | 0.6 | 1.1 | 0.4 |

Item Matrix

# Variations

---

- Adding biases

- $b_{ui} = \mu + b_i + b_u$

- $\hat{r}_{ui} = \mu + b_i + b_u + q_i^T p_u$

- Objective function:

$$\min_{p^*, q^*, b^*} \sum_{(u,i) \in D} (r_{ui} - \mu - b_i - b_u - q_i^T p_u)^2 + \lambda (||q_i||^2 + ||p_u||^2 + \sum_u b_u^2 + \sum_i b_i^2)$$

- Adding temporal dynamics

- $\hat{r}_{ui}^{(t)} = \mu + b_i(t) + b_u(t) + q_i^T p_u(t)$

# Results

# Implicit Feedback Models

---

- Only implicit signals are received
  - E.g., click though, music streaming play
- Methods:
  - Turn it into binary classification problem: **Logistic Matrix Factorization**
    - Johnson, Logistic Matrix Factorization for Implicit Feedback Data, NIPS workshop 2014
  - Turn it into ranking problem: **BPR: Bayesian Personalized Ranking**
    - Rendel et al., BPR: Bayesian Personalized Ranking from Implicit Feedback, UAI'09

# Logistic MF

---

- Model:

$$p(l_{ui} | x_u, y_i, \beta_i, \beta_j) = \frac{\exp(x_i y_i^T + \beta_u + \beta_i)}{1 + \exp(x_u y_i^T + \beta_u + \beta_i)}$$

- Loss function

- For each user-item pair:

$$J_{ui} = -\mathbf{1}_{(l_{ui}=1)} \log p(l_{ui} = 1) - \mathbf{1}_{(l_{ui}=0)} \log p(l_{ui} = 0)$$

# Bayesian Ranking

- Data re-arrangement:

- $D_S = \{(u, i, j) \mid i \in I_u^+ \text{ and } j \in I \setminus I_u^+\}$

- For user  $u$ , s/he ranks item  $i$  higher than  $j$ ,

- Model:

$$p(i >_u j \mid \Theta) = \sigma(\hat{x}_{uij}(\Theta))$$

where  $\hat{x}_{uij} = \hat{x}_{ui} - \hat{x}_{uj}$  and  $\hat{x}_{ui} = \langle \mathbf{w}_u, \mathbf{h}_i \rangle$

- Loss Function

$$\prod_{u \in U} p(>_u \mid \Theta) = \prod_{(u, i, j) \in U \times I \times I} p(i >_u j \mid \Theta)^{\delta((u, i, j) \in D_S)} \cdot (1 - p(i >_u j \mid \Theta))^{\delta((u, j, i) \notin D_S)}$$

# Issues of CF

---

- **Cold Start**: There needs to be enough other users already in the system to find a match.
- **Sparsity**: If there are many items to be recommended, even if there are many users, the user/ratings matrix is sparse, and it is hard to find users that have rated the same items.
- **First Rater**: Cannot recommend an item that has not been previously rated.
  - New items
  - Esoteric items
- **Popularity Bias**: Cannot recommend items to someone with unique tastes.
  - Tends to recommend popular items.

# Recommender Systems

---

- What is Recommender System?
- Collaborative Filtering
- Content-based Recommendation 
- Hybrid methods
- Evaluation Metrics
- Summary

# Content-based recommendation

---

- Collaborative filtering does **NOT** require any information about content,
  - However, it might be reasonable to exploit such information
  - E.g. recommend fantasy novels to people who liked fantasy novels in the past
- What do we need:
  - Some information about the available items such as the genre ("content")
  - Some sort of *user profile* describing what the user likes (the preferences)
- The task:
  - Learn user preferences
  - Locate/recommend items that are "similar" to the user preferences

# Content representation and item similarities

## User profile

| Title                | Genre             | Author            | Type      | Price | Keywords   |
|----------------------|-------------------|-------------------|-----------|-------|--|
| The Night of the Gun | Memoir            | David Carr        | Paperback | 29.90 | Press and journalism, drug addiction, personal memoirs, New York |
| The Lace Reader      | Fiction, Mystery  | Brunonia Barry    | Hardcover | 49.90 | American contemporary fiction, detective, historical             |
| Into the Fire        | Romance, Suspense | Suzanne Brockmann | Hardcover | 45.90 | American fiction, Murder, Neo-nazism                             |
| ...                  |                   |                   |           |       |  |

## Item

| Title | Genre             | Author                         | Type      | Price | Keywords                    |
|-------|-------------------|--------------------------------|-----------|-------|-----------------------------|
| ...   | Fiction, Suspense | Brunonia Barry, Ken Follet, .. | Paperback | 25.65 | detective, murder, New York |

- Simple approach
  - Compute the similarity of an unseen item with the user profile based on the keyword overlap (e.g. using the Dice coefficient)
  - $$\text{sim}(b_i, b_j) = \frac{2 * |\text{keywords}(b_i) \cap \text{keywords}(b_j)|}{|\text{keywords}(b_i)| + |\text{keywords}(b_j)|}$$
- Other advanced similarity measure

# Recommender Systems

---

- What is Recommender System?
- Collaborative Filtering
- Content-based Recommendation
- Hybrid methods 
- Evaluation Metrics
- Summary

# Hybrid Methods

---

- Combining both user-item interaction and other external sources of information
- One example:
  - Factorization Machines
  - Steffen Rendle, “Factorization Machines,” in ICDM’10, Sydney, Australia.

# Factorization Machines

---

- Treat each user-item transaction as one data point
  - $U = \{\text{Alice (A), Bob (B), Charlie (C), ...}\}$
  - $I = \{\text{Titanic (TI), Notting Hill (NH), Star Wars (SW), Star Trek (ST), . . .}\}$
  - $S = \{(\underline{\text{A, TI, 2010-1, 5}}), (\text{A, NH, 2010-2, 3}), (\text{A, SW, 2010-4, 1}), (\text{B, SW, 2009-5, 4}), (\text{B, ST, 2009-8, 5}), (\text{C, TI, 2009-9, 1}), (\text{C, SW, 2009-12, 5})\}$

# FM: Feature Preparation

- Each data point has a feature vector  $\mathbf{x}$ , and a target value (e.g., rating score)

|                    | Feature vector $\mathbf{x}$ |   |   |     |       |    |    |    |     |                    |     |     |     |     | Target $y$ |                  |    |    |    |     |   |           |
|--------------------|-----------------------------|---|---|-----|-------|----|----|----|-----|--------------------|-----|-----|-----|-----|------------|------------------|----|----|----|-----|---|-----------|

# The Model

---

- Model second-order interaction to overcome the sparsity

$$\hat{y}(\mathbf{x}) := w_0 + \sum_{i=1}^n w_i x_i + \sum_{i=1}^n \sum_{j=i+1}^n \langle \mathbf{v}_i, \mathbf{v}_j \rangle x_i x_j$$

- $w_0$ : *global bias*
- $w_i$ : *strength of  $i$ th variable*
- $\hat{w}_{ij} = \langle \mathbf{v}_i, \mathbf{v}_j \rangle$   
: *strength of the interaction of  $i$ th and  $j$ th variable*
  - E.g., interaction between Alice and Titanic, or Alice and Bob

# Time Complexity of Second-Order Interaction

- $O(kn)$ 
  - $k$ : dimension of  $\mathbf{v}$ ,  $n$ : dimension of  $\mathbf{x}$

$$\begin{aligned} & \sum_{i=1}^n \sum_{j=i+1}^n \langle \mathbf{v}_i, \mathbf{v}_j \rangle x_i x_j \\ &= \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \langle \mathbf{v}_i, \mathbf{v}_j \rangle x_i x_j - \frac{1}{2} \sum_{i=1}^n \langle \mathbf{v}_i, \mathbf{v}_i \rangle x_i x_i \\ &= \frac{1}{2} \left( \sum_{i=1}^n \sum_{j=1}^n \sum_{f=1}^k v_{i,f} v_{j,f} x_i x_j - \sum_{i=1}^n \sum_{f=1}^k v_{i,f} v_{i,f} x_i x_i \right) \\ &= \frac{1}{2} \sum_{f=1}^k \left( \left( \sum_{i=1}^n v_{i,f} x_i \right) \left( \sum_{j=1}^n v_{j,f} x_j \right) - \sum_{i=1}^n v_{i,f}^2 x_i^2 \right) \\ &= \frac{1}{2} \sum_{f=1}^k \left( \left( \sum_{i=1}^n v_{i,f} x_i \right)^2 - \sum_{i=1}^n v_{i,f}^2 x_i^2 \right) \end{aligned}$$

# Apply to Recommendation

---

- **Explicit Feedback:**
  - Treat it as a prediction task, with mean square error loss
- **Implicit Feedback:**
  - Treat it as a binary classification or ranking task, with logistic loss or pairwise logistic loss
- **Learning:**
  - Stochastic gradient descent

# Recommender Systems

---

- What is Recommender System?
- Collaborative Filtering
- Content-based Recommendation
- Hybrid methods
- Evaluation Metrics 
- Summary

# Accuracy measures: Explicit Feedback

---

- Datasets with items rated by users
  - MovieLens datasets 100K-10M ratings
  - Netflix 100M ratings
- Historic user ratings constitute ground truth
- Metrics measure error rate
  - Mean Absolute Error (*MAE*) computes the deviation between predicted ratings and actual ratings

$$MAE = \frac{1}{n} \sum_{i=1}^n |p_i - r_i|$$

- Root Mean Square Error (*RMSE*) is similar to *MAE*, but places more emphasis on larger deviation

$$RMSE = \sqrt{\frac{1}{n} \sum_{i=1}^n (p_i - r_i)^2}$$

# Implicit Feedback: Precision and Recall

---

- **Precision:** a measure of exactness, determines the fraction of relevant items retrieved out of all items retrieved
  - E.g. the proportion of recommended movies that are actually good

$$\text{Precision} = \frac{tp}{tp + fp} = \frac{|good\ movies\ recommended|}{|all\ recommendations|}$$

- **Recall:** a measure of completeness, determines the fraction of relevant items retrieved out of all relevant items
  - E.g. the proportion of all good movies recommended

$$\text{Recall} = \frac{tp}{tp + fn} = \frac{|good\ movies\ recommended|}{|all\ good\ movies|}$$

# More Implicit Feedback Measures

---

- Precision@k; recall@k
- AUC:
  - Area under ROC curve
- Area under Precision-Recall Curve
- MRR:
  - Mean reciprocal rank over a set of queries  $Q$
  - $MRR = \frac{1}{|Q|} \sum_{i=1}^{|Q|} \frac{1}{rank_i}$ ,  $rank_i$  is the rank position of the first relevant item for the  $i$ th query

# Recommender Systems

---

- What is Recommender System?
- Collaborative Filtering
- Content-based Recommendation 
- Hybrid methods
- Evaluation Metrics
- Summary

# Summary

---

- Recommendation
  - User-based CF, matrix factorization-based CF
  - Explicit feedback, implicit feedback
  - Content-based recommendation
  - Hybrid methods
  - Evaluation
