Five stars for getting what you pay for here. The food is good and the price is affordable. A great location right off Wilshire, very clean inside, and family friendly. The menu has more than burgers which is great. The steak sandwiches are delicious as well, I favor the teriyaki. The ahi is pretty good too and usually seared just perfectly. Also the salads aren't that bad as well. The soda fountain is the usual at places like this. This place has two signature drinks which are pretty refreshing, cucumber and strawberry.

2. How to train a robust classifier?

# End-to-End Training for WE Selector

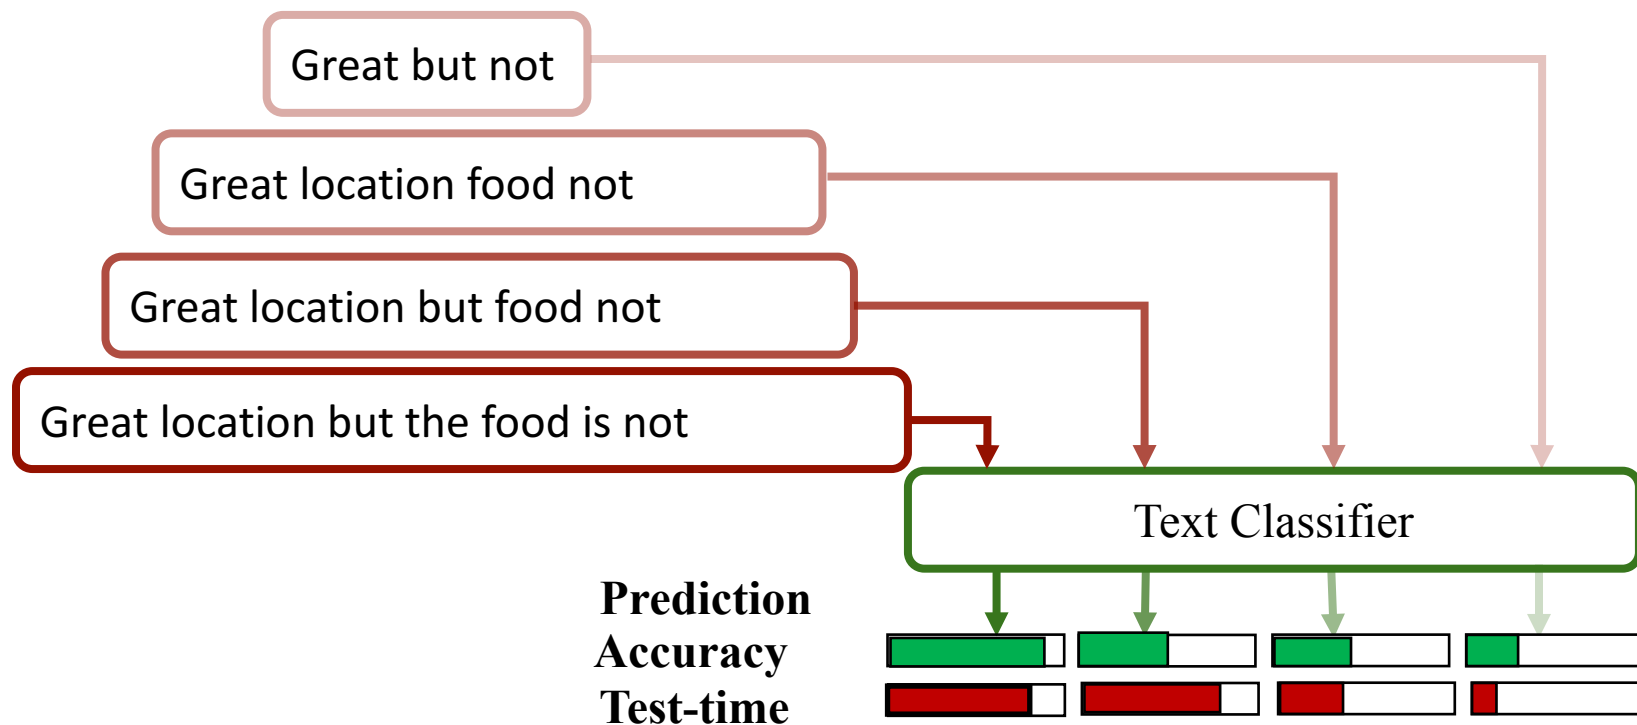

- Selector has to be light-weight
- We consider a selector based on word-embedding
  - $P(\text{word } x \text{ is selected}) = \sigma(\theta^T \vec{x})$
  - **End-to-end** training [Lei et al. (2016)]
  - L1-regularizer to encourage sparsity

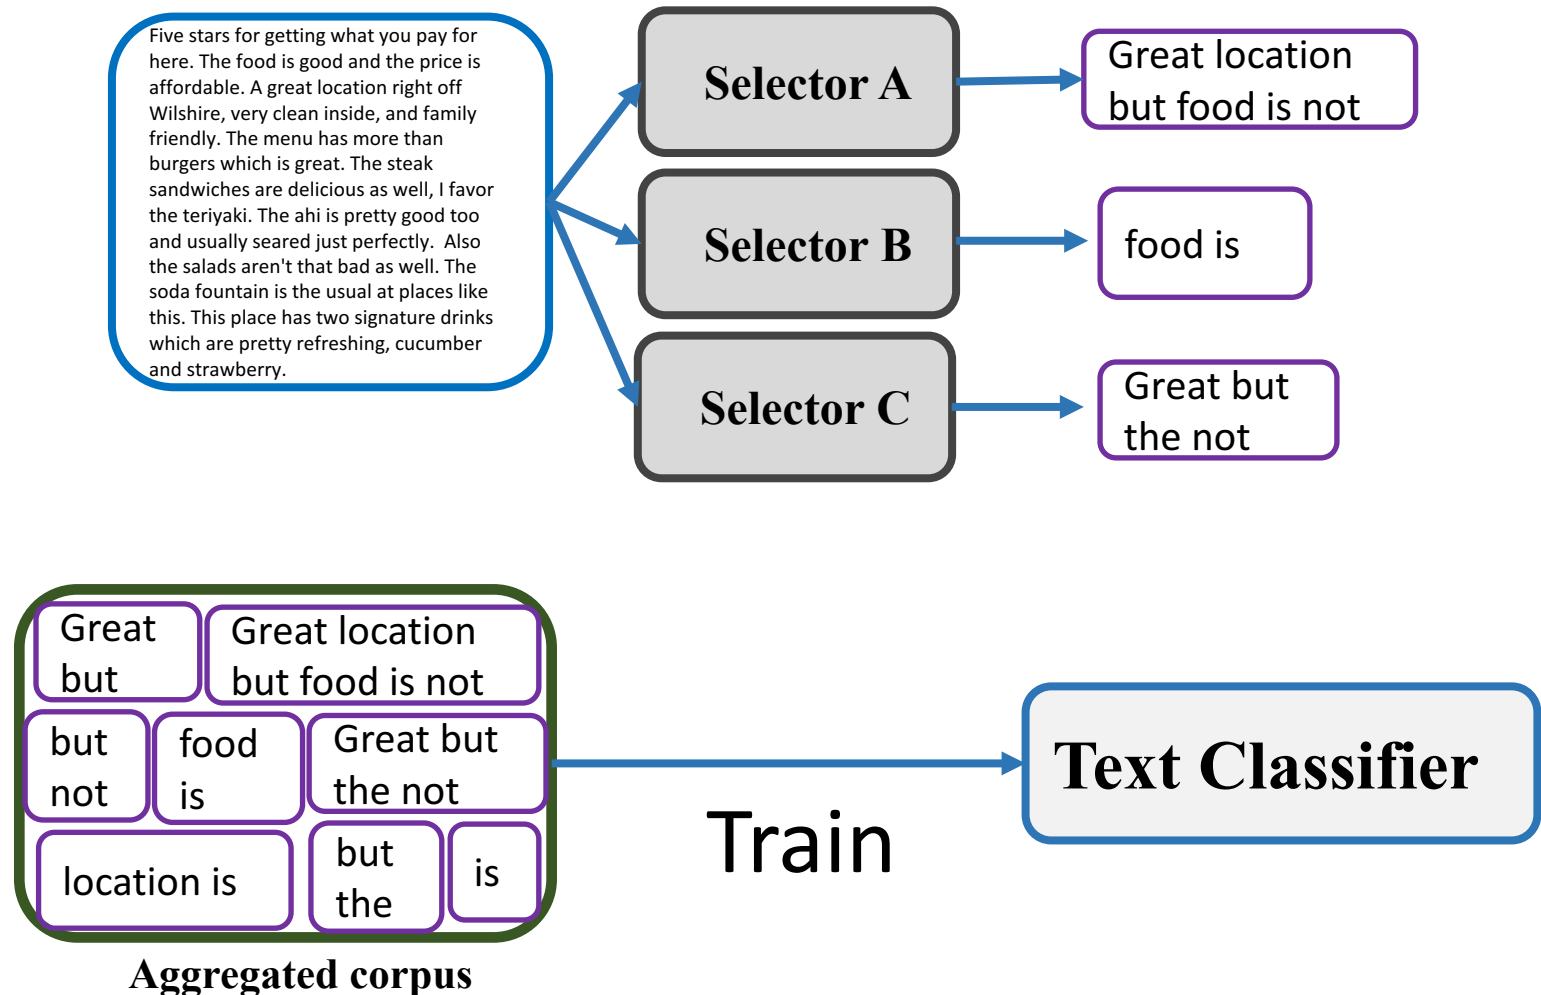

# Key Challenges - Fractured Texts

- ❖ Text classifier is not trained to deal with fractured texts

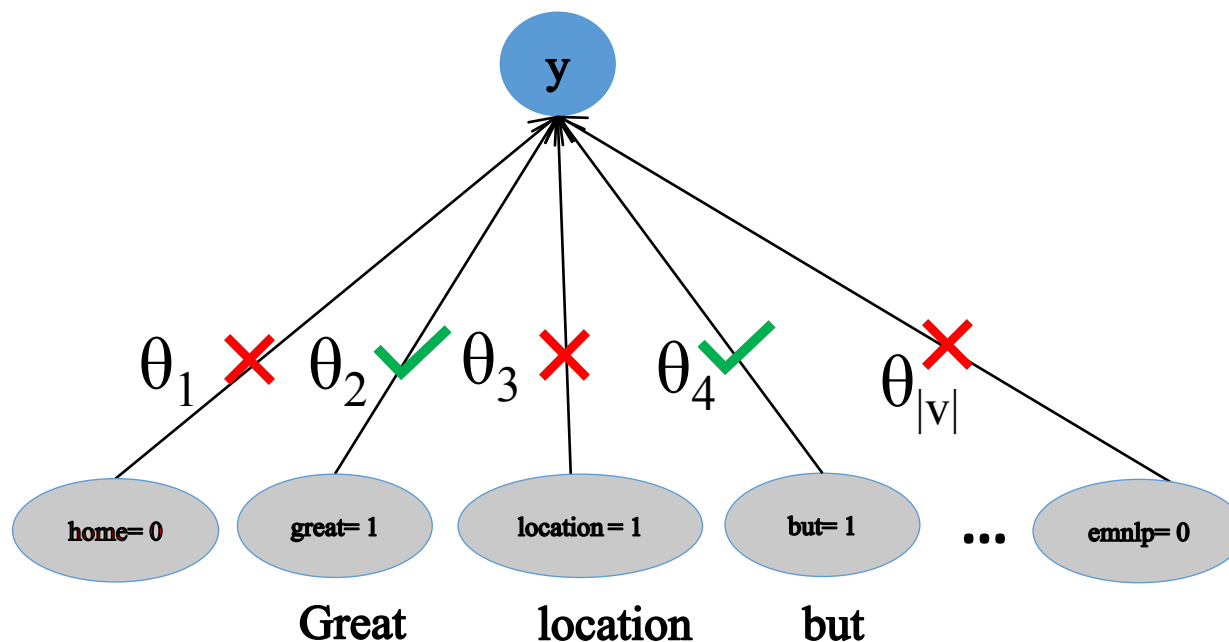

# Training a Robust Classifier with Data Aggregation

# An Alternative Selector

- L1-regularized Bag-of-Words Model

$$\theta^* = \operatorname{argmin}_{\theta} \sum_{(x,y)} \log (1 + \exp(-y \theta^T \cdot \vec{x})) + \frac{1}{b} \|\theta\|_1$$

$b$ : selection rate

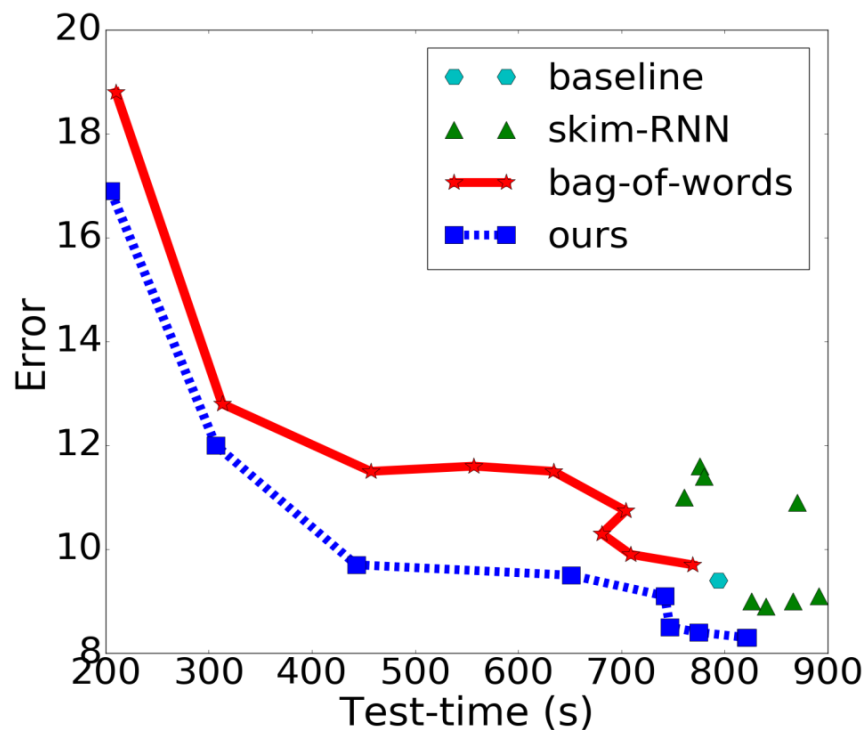

# Related Work

- ❖ Skip/Skim unimportant Text
  - ❖ Skip-RNN [Campos et al., 2017]
  - ❖ Skim-RNN [Seo et al., 2018]
  - ❖ Our approach is agonistic to text classifier
- ❖ Model Compression [Bucila et al., 2006]

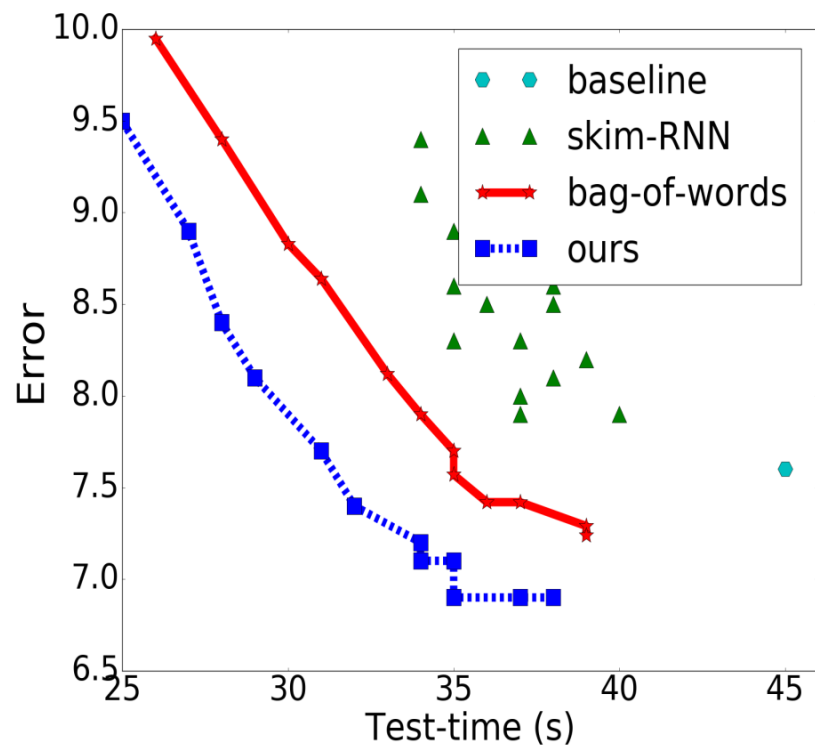

# Experiment Setting

- Datasets: SST-2, IMDB, AGNews, and Yelp
- Classifiers: LSTM, BCN [McCann et al., 2017]
- Aggregate corpus from both selectors:
  - Selection rate = {50%, 60%, 70%, 80%, 90%, 100%}

# Error Rate v.s. Test-Time

IMDB

AGNews

Kai-Wei Chang (<http://kwchang.net>)

# Conclusion

- We present a selector-classifier meta framework for building efficient text classifier
- We propose efficient selectors and data aggregation scheme to train classifiers that are compatible with fractured text selected at any rate.
